

Following integration with quality, environment and safety we address internal and external interested parties with our mission:

„We realize the importance of sustainability support. “

Top management is aware of its responsibility and commits itself to implement and support improvement of the environmental and energetic management system efficiency, to adhere to all relevant binding obligations, legal and other regulations, interested parties' requirements and to apply risk-oriented management including assurance of environmental protection.

An Environmental policy is based on these principles:

COMPLIANCE

Our projects contribute to the climate changes mitigation and adaptation. We determine and manage all significant environmental impacts of our products and services, from design to service throughout the entire life cycle. We increase the Nature care, meet individual requirements with full respect all legal and other regulations.

RESPONSIBILITY

We strive to be the best contractor of stable and semi-stable fire extinguishers and a supplier of fire and rescue equipment. We encourage responsible thinking for new opportunities and strengthen the responsibility of all employees and collaborators for continual improvement of environmental performance particularly in the area of reducing greenhouse gas emissions.

AWARENESS

For the systematic management of environmental aspects and impacts on the environment and energetic effectivity, we take actions to influence them in order to minimize environmental pollution, wastes generation, resource consumption, potential incidents and risks. We are learning with each project and it is a challenge for the assessment of new threats and impacts such as those connected with usage of chemical substances.

PROTECTION

We protect the ecosystems value, environment and interested parties included all people and we prefer to avoid nonconformities, situations environmental pollution and other risks. We try to leverage opportunities to prevent or mitigate adverse environmental impacts and enhance beneficial impacts, in the area of resource, water and energy management and responsible of management with chemicals.

PARTNERSHIP

We manage collaboration with interested parties so that their products, services, and processes are in compliance with the requirements to support the efficiency of our environmental system. We establish the environmental objectives for use of renewable nature resources and energy, reduction of consumption of natural resources and protection of soil, water and air. For our processes, we analyse all impacts on energy efficiency, including significant energy use.

COMMUNICATION

We support all interested parties to take Earth protection actions by effectively communicating safety data about greenhouse gases. Taking into account the resources of the Earth, we share the project's experiences, including deepening our knowledge of the benefits of improved personal behaviour in the environmental field and the use of renewable energy sources.
